

Our business is backed by electricity generated from low-carbon sources.

We're proud to have chosen an electricity supply that is backed by low-carbon generation.

One way we're managing our carbon emissions is by choosing an electricity supplier that works to lower the emissions associated with the power they supply to us. It is a part of us being a more sustainable business.

Every unit of electricity we need to run our business is now matched by one that's guaranteed to come from a recognised low-carbon electricity generation source: nuclear energy.

As a result, under the GHG Protocol greenhouse gas reporting standard we can report far lower carbon emissions from our electricity purchases for our 'market based' figure, than if we had chosen an electricity supply backed by generation sources such as coal or gas.

Our market-based emissions figure reflects our informed choice of electricity contract, whilst the location-based figure we report alongside it reflects the UK electricity supply mix which is where we're based.

EDF Energy's Blue for Business product and electricity supply mix is independently assured by PwC, whose report can be found at [edfenergy.com/blueassurance](https://www.edfenergy.com/blueassurance). All source certification meets GHG Protocol Scope 2 Guidance Quality Criteria.
