WE’VE GOT THE POWER!

QUICK ACTIVITY

KS4
Lesson overview
This quick activity reinforces students’ knowledge about the energy mix; how we generate electricity using renewable (wind, solar) and non-renewable (gas, nuclear) energy resources; and the impact of human activity on the environment.

Learning objectives
► Understand the difference between renewable and non-renewable energy resources
► Consider the factors that influence a country’s energy mix
► Understand key definitions relating to national and global energy resources
► Develop awareness about the energy mix around the world
► Identify job opportunities in the low-carbon energy sector

Gatsby Benchmarks
2: Learning from career and labour market information:
Find out about the variety of jobs in the low-carbon energy industry – and HPC in particular.
4: Linking curriculum learning to careers: Identify the career pathways into different roles in the energy industry.

Timings
► Main activity: 45 mins
► Careers in energy: 15 mins

Materials and set-up
This Activity Pack contains the following materials:
► Teacher notes
► Student worksheet

This activity can be used in the classroom, led by a teacher. Or share the Student worksheet for students to use independently – with a link to the Teacher notes if they need further guidance.

This quick activity is a good follow-up to The Mighty Atom activity

HPC Inspire
We’re Hinkley Point C’s Education Programme in Somerset and the wider South West region. And we’re here to help young people take advantage of the huge opportunities that the construction and operation of HPC has to offer. We do this through a range of fun and innovative activities: including hands-on STEM workshops, careers assemblies and online learning resources.
THE MAIN ACTIVITY  
(45 mins)

Part 1: Renewable or non-renewable?
Do you know which energy resource is which?

Look at the pictures of the energy resources in your Worksheet. Use the table to categorise each as renewable or non-renewable.

<table>
<thead>
<tr>
<th>RENEWABLE ENERGY RESOURCE</th>
<th>NON-RENEWABLE ENERGY RESOURCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solar</td>
<td>Coal</td>
</tr>
<tr>
<td>Wind</td>
<td>Oil</td>
</tr>
<tr>
<td>Wave</td>
<td>Gas</td>
</tr>
<tr>
<td>Hydro</td>
<td>Nuclear</td>
</tr>
<tr>
<td>Biofuel</td>
<td></td>
</tr>
<tr>
<td>Geothermal</td>
<td></td>
</tr>
<tr>
<td>Tidal</td>
<td></td>
</tr>
</tbody>
</table>

Did you know... The Dinorwig hydro power station in Wales can power up from zero to 1,320 MW in 12 seconds!¹

¹http://www.electricmountain.co.uk/Dinorwig-Power-Station
**Part 2: How well do you know your energy resources?**

*Complete the table in your Worksheet – consider what additional information you can find out about each energy resource to include in the final column.*

<table>
<thead>
<tr>
<th>ENERGY RESOURCE</th>
<th>RENEWABLE/ NON-RENEWABLE?</th>
<th>IMPACT ON ENVIRONMENT</th>
<th>POWER OUTPUT</th>
<th>RELIABILITY</th>
<th>COST</th>
<th>OTHER CONSIDERATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nuclear</td>
<td>Non-renewable (it uses a metal called uranium)</td>
<td>Zero carbon emissions during generation</td>
<td>High</td>
<td>Good</td>
<td>Building a nuclear power station is a big investment project.</td>
<td>Nuclear waste remains radioactive, so the waste products require long-term management in special facilities.</td>
</tr>
<tr>
<td>Wind</td>
<td>Renewable</td>
<td>Zero carbon emissions produced from generation</td>
<td>Low</td>
<td>Variable</td>
<td>Relatively low cost to run. Offshore wind farms are more expensive to build due to the complications of building out at sea.</td>
<td>The UK is the windiest country in Europe. Limited development onshore due to available land space.</td>
</tr>
<tr>
<td>Solar</td>
<td>Renewable</td>
<td>Zero carbon emissions produced from generation</td>
<td>Low</td>
<td>Variable</td>
<td>Low</td>
<td>The UK gets enough sunlight to be a viable energy source. Development restricted by the amount of land space available.</td>
</tr>
<tr>
<td>Gas</td>
<td>Non-renewable</td>
<td>Produces carbon emissions during generation</td>
<td>High</td>
<td>Good</td>
<td>Fairly low-cost</td>
<td>Gas power stations can respond very quickly to increases in energy demand.</td>
</tr>
</tbody>
</table>
Part 3: Dictionary definitions

Define the following energy terms in your Worksheet:

**Reliable:** A power source that has a predictable output and can run constantly.

**Variable:** A power source with a changeable output. For instance, renewables such as wind and solar, which stop generating power when the wind stops blowing and the sun stops shining, respectively.

**Renewable:** An energy resource that will never run out, but which is constantly replenished (like wind, solar and hydro).

**Non-renewable:** An energy resource that will run out. Fossil fuels are non-renewable as they have a finite lifespan.

**Low-carbon:** An energy source that generates very little or zero carbon dioxide emissions.

---

Did you know... Just one kilo of uranium (the same weight as about two bags of sugar) makes enough electricity to power your home for almost 11 years? The same amount of coal could only power your home for about 4.5 hours.²

---

Part 4: 3x3 challenge

How quick can you complete the 3x3 challenge to test your knowledge of our energy needs?

1. Q. Broadly, we need energy for heating, transport and ?
   A. Electricity generation – and our reliance on electricity is growing, as we switch to electric cars, electric heating etc.

2. Q. In the UK, the three main sources of energy for electricity in 2018 were gas, renewables and ?
   A. Nuclear

3. Q. The three main greenhouse gases are carbon dioxide, water vapour and ?
   A. Methane

---

Do you know... It’s now widely accepted that the main cause of climate change is human activity. While natural events – like volcanoes erupting – can release carbon dioxide into the atmosphere and cause climate change. Evidence shows that the increased amount of greenhouse gases in the atmosphere is due to man-made activities, like burning fossil fuels. Read more on the Met Office website.

---

² The Pod’s How we make electricity from nuclear power poster: https://jointhepod.org/teachers/posters/how-electricity-is-made-from-nuclear-power-poster
Part 5: Daily habits

Take a look at the diagram in your Worksheet, then answer the questions below.

Daily profile for electricity use in all test households (excluding electric heating)

Source: https://energysavingtrust.org.uk/sites/default/files/reports/PoweringthenationreportCO332.pdf

1. Q. What’s the time range for the three main peaks of electricity use over the day?
   A. Approx 8-10am; 11.30am-1.30pm; 5.30-8.30pm.

2. Q. Give two reasons for these peaks:
   A. Answers might include:
      ▶ These are the times when people are preparing and eating – cooking can involve the use of lots of appliances;
      ▶ These are the times when most people are in the home;
      ▶ There’s demand for lighting mainly in the morning and evening, when it’s dark;
      ▶ These might be the times people are relaxing e.g. playing on games consoles, online with friends, watching TV etc.

3. Q. Why do you think electricity is still being used at night?
   A. Many household appliances are on all the time (e.g. fridge and WiFi router). Some people use the evenings to run wash cycles or charge their devices too (although these can be a fire risk).
Part 6: Globetrotters

How much do you know about our global use of energy?

Direct students to the Global Energy Statistical Yearbook\(^3\) and ask them to use this site to find out the answers to the questions in their Worksheet.

1. **Q.** Which countries are the three biggest consumers of energy in the world?
   **A.** China, the US and India.

2. **Q.** Which countries are the three biggest consumers of electricity in the world?
   **A.** China, the US and India (again).

3. **Q.** Which continent generated most of the growth in global electricity consumption this year?
   **A.** Asia – up almost 80%, with China accounting for the lionshare (nearly 60%).

4. **Q.** What factors drove an increase in electricity in different countries?
   **A.** Reasons might include economic growth; industrial demand; and increased electricity consumption for appliances and air-conditioning.

5. **Q.** Which three countries generate the most electricity from renewables?
   **A.** Norway, New Zealand and Brazil.

6. **Q.** Below is the dataset for the worldwide total primary energy supply, by source, for 2017\(^4\). Use the data to draw a pie chart to show the global energy mix.

<table>
<thead>
<tr>
<th>ENERGY RESOURCE</th>
<th>UNITS (KTOE)</th>
<th>% OF ENERGY MIX</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coal</td>
<td>3,789,934</td>
<td>27%</td>
</tr>
<tr>
<td>Natural gas</td>
<td>3,106,799</td>
<td>22%</td>
</tr>
<tr>
<td>Nuclear</td>
<td>687,481</td>
<td>5%</td>
</tr>
<tr>
<td>Hydro</td>
<td>351,029</td>
<td>3%</td>
</tr>
<tr>
<td>Wind and solar, etc.</td>
<td>256,830</td>
<td>2%</td>
</tr>
<tr>
<td>Biofuels</td>
<td>1,329,064</td>
<td>10%</td>
</tr>
<tr>
<td>Oil</td>
<td>4,449,499</td>
<td>32%</td>
</tr>
</tbody>
</table>

\(^3\)All answers correct as of June 2020

CAREERS IN ENERGY

15 mins

Could your future career be at HPC?

Hinkley Point C is the new power station we’re building in Somerset. It’ll generate 7% of the UK’s electricity – that’s enough to power six million homes! And it’ll be low-carbon electricity, as generating electricity from nuclear power doesn’t produce any carbon emissions. So it’ll help the UK Government achieve its target of net-zero carbon emissions by 2050 too.

At Hinkley Point C, we’ll be training 1,000 apprenticeships during the build and operation of the new power station. Here are some of the job roles that will be available:

During the build:

Once the power station is operational:

Choose one or more of the following careers activities to run with students.

1. Meet Caitlin…

To find out what it’s like to work at HPC, watch this day in the life film of Caitlin, a quantity surveyor apprentice on the project. Then answer this question:

Q. Give three benefits of being an apprentice at EDF.

A. Students could have given their answers from the following: working on one of the biggest construction projects in Europe; getting hands-on experience; working on-site and in the office; receiving a great salary and benefits package; furthering their education with a recognised qualification; getting a great start to their career; and avoiding debt.

2. Myths about apprenticeships

Watch this film about five myths about apprenticeships and list the five myths below, along with an explanation for each.

1. You earn less than minimum wage as an apprentice. But in fact:
   - Your pay increases with level, age and time on the programme
   - It boosts your future earnings
   - You’ll receive paid holidays

2. It’s easier than university or college. But in fact:
   - You’ll need to be committed and professional
   - You’re paid to study… with no tuition fees
   - You could end up with a degree

3. The job prospects aren’t great. But in fact:
   - 64% of apprentices stay on with the same employer
   - 92% of apprentices said their career prospects had improved
   - Employers can favour apprenticeships over uni qualifications
3. Jobs of the future
Research three jobs in the low-carbon energy industry. (Clue: take a look at sites like the National Careers Service, Start profile, EDF’s careers pages and associations like RenewableUK). For each, explain what the job involves, what skills you require and the pathway into them.

Did you know... By helping to build or operate a new nuclear power station, you could be part of our low-carbon future? Find out more about the variety of jobs available at HPC on Start Profile.
